AND FRIENDLY**

Plus: A PEEK AT OUR GOLF APPAREL UPDATE

SWEET STUFF

In addition to the seam-sealed zippers that also have a nice locking feature built-in, The Players 4 Plus StaDry bag has two large beverage pockets built in at the bottom of the bag and a full-length apparel pocket that can be easily expanded with a hidden zipper. A quick-access accessories pocket is in a handy upper portion of the bag, and the new tee pocket is positioned right above the ball compartment.

The new premium double strap system makes for easy on-off between shots and Titleist has added a padded back hub with a foam package for even more comfort. The high-grade lightweight aluminum legs fold easily and can be strapped securely for cart use, and the pen storage pocket and the two Velcro glove-patches are also nice touches—in addition to the 8 pockets on the bag. The best part is that it only weighs in at 4.2 pounds.

The Hybrid collection of golf bags was designed by Titleist for players that want to walk or ride and offers features that make them fit well on most golf carts—such as the added cart strap loop that allows access to the valuables pocket when strapped into the cart.

This bag also offers a new push-cart rest feature.

The Hybrid 14 golf bag, with 14 full-length club dividers, provides superior organization with maximum storage, while the Hybrid 5 golf bag offers a more lightweight cart-friendly design with four full-way dividers.

These bags can also be personalized, including some exclusive patches such as a Shamrock or Hole-In-One.

Claw Pro Glove

One of the most durable and sure-grip golf gloves we have seen in a while—the Claw—has just released a new and improved version—and the features are readily apparent.

The new Claw Pro by CaddyDaddy Golf offers some added stability on the top hand and grip on the index finger and thumb. The fit is much more secure and exact—and designed for players with higher swing speeds for more control.

SWEET STUFF

The darker color of the new Claw Pro is sharp and accented with black edges—but the extra grip strength and tackiness readily stands out with this glove that has an exclusive silicone grip so the palm will not blacken, crack, or tear. It is machine washable and has outstanding ventilation, and even after extensive wear and sweat, these gloves still look new and fresh.

As opposed to most golf gloves that are leather, the Claw Pro is made of 100% synthetic suede and mesh—with a silicone web coating on the palm, thumb and index finger.

The company notes that it will last three to five times longer than traditional leather gloves. They come in six men's sizes: XL, L, M, S and Cadet L and M.

The Claw glove is available at: www.clawglove.com, on Amazon and at select retailers.

Copper Joint Compression Gear

The benefits of compression gear for physical activity have been well documented, but there is a growing awareness that combining the benefits of compression with copper-infused materials can even improve the benefits of this technology.

CopperJoint, a Wyoming company that has spent more than half a decade developing copper-infused athletic wear, has several products that can help golfers with those aches and pains that go along with the game.

From compression socks, sleeves, braces and even insoles, CopperJoint has utilized the healing property of genuine copper ions embedded in the fabric to help provide pain relief directly to the sore or injured area. CopperJoint garments are crafted from breathable, moisture wicking performance fabric for ultimate comfort and feature an anti-slip design to help prevent them from rolling or sliding off during physical activity.

The long compression socks are especially effective during the colder months and help keep legs, ankles and feet feeling fresh and warm and rested throughout the round—almost a soothing feeling for the part of your body that gets the most workout during a game. The other sleeves and braces do the same for upper and lower body

joints that tend to be problem areas.

Although not yet scientifically proven, users have hailed the healing power of copper for years. It is believed that damaged nerves trap electricity in your body causing pain, burning, redness, loss of appetite, insomnia, headaches and more. Copper pulls the electricity from your body to relieve pain and allow healing.

As a bonus, copper contains antibiofouling (or the prevention of microorganisms, plants, algae, or animals accumulating on wetted surfaces) and antimicrobial applications/properties. Thus, embedding copper into the fabric of compression garments helps to keep them odor- and germ-free. The fabric also helps skin free of fungus—even in extremely hot temperatures. And it helps reduce the spread of bacteria.

These products can be worn all day and night, and are made with 80% nylon, 12% copper nylon and 8% spandex. The four-way compression sleeve within the socks are designed for full range of motion and mobility, and the patented material is moisture wicking for added comfort.
